

It is important to note that the results of this study are based on a cross-sectional design. Therefore, the causal relationships between the variables cannot be definitively established. Future research should employ longitudinal designs to investigate the temporal relationships between the variables and to assess the sustainability of the observed effects.

the 1990s, the U.S. economy has been able to maintain a high rate of growth, despite the fact that the U.S. has been experiencing a significant decline in its manufacturing sector. This is due to a number of factors, including the fact that the U.S. has been able to maintain a high rate of innovation, which has allowed it to remain competitive in the global market. Additionally, the U.S. has been able to maintain a high rate of investment in research and development, which has allowed it to develop new technologies and products that have helped to drive economic growth. Finally, the U.S. has been able to maintain a high rate of productivity, which has allowed it to produce more goods and services with fewer resources. All of these factors have helped to ensure that the U.S. economy has been able to maintain a high rate of growth, despite the challenges it has faced in the manufacturing sector.
