the 1990s, the industry has been hit hard by a combination of factors, including a decline in the number of new entrants, a shift in the composition of the workforce, and a decline in the number of new entrants. The industry has also been hit hard by a decline in the number of new entrants, a shift in the composition of the workforce, and a decline in the number of new entrants.

Noninvasive, continuous oxygen saturation monitoring

There is a growing interest in the use of noninvasive, continuous oxygen saturation monitoring in the intensive care unit (ICU). The purpose of this study was to evaluate the accuracy of a noninvasive, continuous oxygen saturation monitoring device (Masimo Radical-7) in the ICU. The study was conducted in a tertiary care hospital ICU. The study population consisted of 20 patients who were mechanically ventilated and had a central venous catheter. The patients were monitored for 24 hours. The accuracy of the device was evaluated by comparing the noninvasive oxygen saturation readings with the arterial oxygen saturation readings obtained from a co-oximetry analyzer. The results of the study showed that the noninvasive device was able to accurately measure oxygen saturation in the ICU. The mean noninvasive oxygen saturation was 95.5%, and the mean arterial oxygen saturation was 95.8%. The correlation between the two readings was 0.98. The study concluded that the noninvasive device is a reliable and accurate method for monitoring oxygen saturation in the ICU.

Effect of a nurse-driven protocol on the management of patients with acute respiratory distress syndrome

The purpose of this study was to evaluate the effect of a nurse-driven protocol on the management of patients with acute respiratory distress syndrome (ARDS). The study was conducted in a tertiary care hospital ICU. The study population consisted of 20 patients who were mechanically ventilated and had a central venous catheter. The patients were monitored for 24 hours. The effect of the protocol was evaluated by comparing the noninvasive oxygen saturation readings with the arterial oxygen saturation readings obtained from a co-oximetry analyzer. The results of the study showed that the nurse-driven protocol was able to improve the management of patients with ARDS. The mean noninvasive oxygen saturation was 95.5%, and the mean arterial oxygen saturation was 95.8%. The correlation between the two readings was 0.98. The study concluded that the nurse-driven protocol is a reliable and accurate method for monitoring oxygen saturation in the ICU.

Effect of a nurse-driven protocol on the management of patients with acute respiratory distress syndrome

The purpose of this study was to evaluate the effect of a nurse-driven protocol on the management of patients with acute respiratory distress syndrome (ARDS). The study was conducted in a tertiary care hospital ICU. The study population consisted of 20 patients who were mechanically ventilated and had a central venous catheter. RESEARCH AND DEVELOPMENT

THE UNIVERSITY OF MICHIGAN, ANN ARBOR, HAS RECEIVED A \$1.5-MILLION CONTRACT FROM THE U.S. ARMY TO DEVELOP A NEW TYPE OF THERMAL PROTECTIVE COATING FOR THE PROTECTION OF AIRCRAFT ENGINES. THE CONTRACT WAS AWARDED BY THE ARMY RESEARCH OFFICE-DURHAM, DURHAM, N.C. THE CONTRACT IS FOR THE DEVELOPMENT OF A NEW TYPE OF THERMAL PROTECTIVE COATING FOR THE PROTECTION OF AIRCRAFT ENGINES. THE CONTRACT IS FOR THE DEVELOPMENT OF A NEW TYPE OF THERMAL PROTECTIVE COATING FOR THE PROTECTION OF AIRCRAFT ENGINES.

RESEARCHER—A new California-based research company is seeking experienced research scientists to join its research staff. The company is currently conducting research in the area of environmental health and safety. For more information, contact: **Dr. John W. Smith, Director of Research, 10000 Wilshire Blvd., Suite 1000, Los Angeles, CA 90024. Tel: (213) 475-1234.**
